

High-Risk Neuroblastoma 2

High-risk neuroblastoma (HR-NBL) represents the largest neuroblastoma subgroup. Of 100 patients diagnosed with neuroblastoma in the UK each year, around 50 will have HR-NBL.

The standard-of-care protocols followed at each treatment phase vary internationally. There is a clinical study being run to see how each of the different treatments affect the disease, called "HR-NBL2".

CCLG, in association with the trial, have created videos to help explain HR-NBL treatment and the HR-NBL2 trial.

If you want to know more about treatments for HR-NBL and the HR-NBL2 study, check out the videos at <https://www.birmingham.ac.uk/research/crctu/trials/hr-nbl2/investigators.aspx> or scan the QR code below
